ABSTRACT

Tape fasteners attached to a wearing article are folded in a Z- or an inverted Z-shape. The Z- or the inverted Z-shape is defined by a first tape segment having a free end zone, a second tape segment fixed to a wearer-facing surface of the wearing article and a third tape segment interposed between the first and second tape segments. An inner end zone of the third tape segment is connected to an inner end zone of the second tape segment, extends inwardly of the wearing article beyond the inner end zone of the second tape segment, and is releasably attached to the garment-facing surface of the wearing article.
